

extension 이전

```
let currentForecast = try? JSONDecoder().decode(CurrentForecast.self, from: data)
```

extension 이후

```
let currentForecast = try? CurrentForecast.decode(from: data)
```

JSONDecoder() 안쓰고 Decodable 객체 자체에 extension 걸어버리기

```
extension Decodable {
    static func decode(
        from data: Data,
        decoder: JSONDecoder = JSONDecoder()
    ) throws -> Self {
        return try decoder.decode(self, from: data)
    }
}
```

```
protocol Identifiable {
    static var identifier: String { get }
}

extension Identifiable {
    static var identifier: String {
        return String(describing: self)
    }
}
```

DecodableExtensions 🌐

Then 🌐

객체 초기화 간단히 하기 made by 전수열님

Protocols

Protocol 은 형용사형으로 네이밍 한다.
